~~NINTH~~ CENSUS—VOLUME II.

THE

VITAL STATISTICS OF THE UNITED STATES,

EMBRACING

THE TABLES OF DEATHS, BIRTHS, SEX, AND AGE,

TO WHICH ARE ADDED

THE STATISTICS

OF

THE BLIND, THE DEAF AND DUMB, THE INSANE,
AND THE IDIOTIC.

COMPILED,

FROM THE ORIGINAL RETURNS OF THE NINTH CENSUS,
(JUNE 1, 1870,)

UNDER

THE DIRECTION OF THE SECRETARY OF THE INTERIOR,

BY

FRANCIS A. WALKER,
SUPERINTENDENT OF CENSUS.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1872.

MAPS AND CHARTS CONTAINED IN THIS VOLUME.

	Page.
Consumption	1
Malarial Diseases	145
Typhus, Typhoid, and Enteric Fevers	305
Diarrhœa, Dysentery, and Enteritis	425
Hypsometric Sketch of the United States	513
Temperature Chart	579
Rain Chart	649

REMARKS UPON THE MAPS AND CHARTS.

The four maps of this volume, which present the range, and, within the range, the degree of prevalence, of certain specific diseases, or groups of diseases, viz: 1. Consumption; 2. Malarial diseases; 3. Typhus, typhoid, and enteric fevers; 4. Diarrhœa, dysentery, and enteritis, have been prepared at the Census Office.

In respect to the three charts intended to illustrate certain of the physical characteristics of the United States, the Census Office has been the recipient of favors from individuals and institutions whose names and titles the Superintendent feels it a high honor to be allowed to associate with his work.

To that eminent and venerable scholar, Professor Joseph Henry, secretary of the Smithsonian Institution, acknowledgment is due for the two charts in the present volume, which show severally the annual distribution of rain and the courses of the lines of equal temperature. These charts are based upon the records of the Smithsonian Institution, extending over a period of more than twenty years, and comprise the results of all the observations made, under the direction of that institution, throughout the United States.

Professor A. Guyot, of Princeton College, through his publishers, Messrs. Scribner, Welford & Co., of New York, kindly placed at the disposal of the Census Office the plates of his valuable physical map of the country, to which Professor Charles A. Schott, of the Coast Survey Office, with the permission of Professor Benjamin Peirce, the Superintendent of the United States Coast Survey, has added by far the most complete and accurate series of elevations yet attained.

THE GENERAL TABLES.

OF DEATHS.

Table I.—Deaths in the United States, with Distinction of Sex, by States and Territories, 1870–1850 1
II.—Deaths in the United States, with Distinction of Sex and Age, by States and Territories, 1870 5
III.—Deaths in the United States, with Distinction of Sex and Month of Death, by States and Territories, 1870 9
IV.—Deaths in the United States, with Distinction of Race and Nationality, 1870 13
V.—Deaths in the United States, and in each State and Territory, with Specification of the Cause of Death, and with Distinction of Sex and Age, 1870 17
VI.—Deaths in the United States, and in each State and Territory, with Specification of the Cause of Death, and with Distinction of Sex and Month of Death, 1870 207
VII.—Deaths in the United States, and in each State and Territory, with Distinction of Race and Nationality, 1870. 305
VIII.—Deaths in the United States, and in each State and Territory, with Specification of the Class of Diseases causing Death, and with Distinction of certain Specified Occupations, 1870 401
IX.—Deaths in the United States, with Distinction of Race, Sex, and Age, 1870 413

OF THE BLIND, THE DEAF AND DUMB, THE INSANE AND THE IDIOTIC, BY STATES AND TERRITORIES, 1870.

X.—The Blind, the Deaf and Dumb, the Insane, and the Idiotic, with Distinction of Race and Sex 427
XI.—The Blind, with Distinction of Race and Nativity 431
XII.—The Blind, with Distinction of Race, Age, and Sex 445
XIII.—The Deaf and Dumb, with Distinction of Race and Nativity 451
XIV.—The Deaf and Dumb, with Distinction of Race, Age, and Sex 465

XV.—The Insane, with Distinction of Race and Nativity 471
XVI.—The Insane, with Distinction of Race, Age, and Sex 485
XVII.—The Idiotic, with Distinction of Race and Nativity 491
XVIII.—The Idiotic, with Distinction of Race, Age, and Sex 503
XIX.—Double and Treble Inclusions of Persons in Tables X to XVIII 509

OF BIRTHS.

XX.—The Month of Birth of Persons Born in and Surviving at the Close of the Year ended May 31, 1870, with Comparative Statements for 1860 and 1850 532

OF SEX.

XXI.—Sex, with General Nativity and Race, Distinguishing also the Blacks and Mulattoes, 1870–1850, by States and Territories, [being a reproduction of Table XXII of Volume I] 535

OF AGE.

XXII.—Ages, with Sex at each Period of Life, of the Population of the United States, in the Aggregate, and with Distinction of Nativity and Race, 1870; and also in the Aggregate, with Race, 1860 and 1850 551
XXIII.—Ages, with Sex at each Period of Life, of the Aggregate Population of the United States, by States and Territories, 1870–1850 559
XXIV.—The same, for the Native Population, 1870 579
XXV.—The same, for the Foreign-born Population, 1870 595
XXVI.—The same, for the White Population, 1870–1850 607
XXVII.—The same, for the Native White Population, 1870 623
XXVIII.—The same, for the Foreign-born White Population, 1870 635
XXIX.—The same, for the Colored Population, 1870–1850 647
XXX.—The same, for the Chinese and the Civilized Indian Population, 1870–1850 661
XXXI.—Ages, with Sex, at each Period of Life, of Persons aged Eighty or more Years, in the Aggregate Population of the United States, with Distinction of Nativity and Race, 1870 671
XXXII.—The same, in the Aggregate Population of each State and Territory, 1870 675

CORRESPONDENCE.

DEPARTMENT OF THE INTERIOR, CENSUS OFFICE,
Washington, D. C., October 27, 1870.

GENERAL: I have the honor to inquire whether it will be convenient and agreeable to your office to direct the compilation of the Statistics of Mortality for the Ninth Census of the United States, in so far as to prescribe the classification of diseases to be adopted, and the amount of detail to be retained. A large clerical force is at present engaged in this office on tabulating the returns of assistant marshals; and it is expected that the Statistics of Mortality for the whole country will be completed, so far as merely clerical labor is concerned, within the next six weeks.

Before publication can take place, however, it becomes necessary to determine what classification of diseases shall be adopted; what divisions of the country shall be separately reported, parts of States, entire States, or groups of States; whether the publication shall present the record of deaths by months or by quarters, &c.

It would be far more agreeable to my view of the interests of medical and sanitary science to have the determination of such questions left to your office than to call in at this office the services of an expert, whose treatment of the subject might be influenced by favorite theories, or who might be disposed unduly to magnify his office, and enlarge the bulk of the publication beyond the real demands of science.

Should you kindly consent to take charge of this work, it will be my endeavor to submit the matter in such form as will involve no clerical labor at your office.

Awaiting the favor of your reply, I have the honor to remain, very respectfully, your obedient servant,

FRANCIS A. WALKER, *Superintendent.*

Major General JOSEPH K. BARNES,
Surgeon General, United States Army.

WAR DEPARTMENT, SURGEON GENERAL'S OFFICE,
Washington, D. C., February 29, 1872.

DEAR SIR: I have the honor to transmit a report from Assistant Surgeon J. J. Woodward, United States Army, on duty in this office, who was directed to comply, as far as practicable, with the request contained in your letter addressed to me on the 27th of October, 1870, and which, in my opinion, meets the objects desired in the most satisfactory manner.

I am, sir, very respectfully, your obedient servant,

J. K. BARNES, *Surgeon General.*

General F. A. WALKER,
Superintendent of the Census, Washington, D. C.

SURGEON GENERAL'S OFFICE,
Washington, D. C., February 28, 1872.

GENERAL: I have the honor to report that, in compliance with the instructions of your indorsement of October 31, 1870, on the letter of the Superintendent of Census, dated October 27, 1870, Dr. Billings and I have had frequent conferences with General Walker, in which various points, involved in the determination of the most useful

mode of publishing the facts embraced in the mortality returns of the census of 1870, were discussed, and various recommendations made and adopted.

It now becomes my duty to state briefly the chief matters discussed and the conclusions arrived at.

General Walker, in his letter, asked advice—

1. As to the classification of diseases which should be adopted; 2. As to what divisions of the country should be separately reported, whether parts of States, entire States, or groups of States; 3. Whether the publication should present the record of deaths by months or by quarters.

1. With regard to the classification of diseases, it was recommended, with your approval, that the tabular form adopted should conform in all essential particulars with the nomenclature and classification published by the Royal College of Physicians of London, in 1869.

It was, of course, fully considered that no classification, based essentially upon pathological views, or upon professional ideas, would be likely to prove acceptable to the majority of medical men; for, in the present condition of medical science, insurmountable differences of opinion still exist as to many unsettled points which must necessarily be involved in the construction of any classification based upon a consideration of the actual nature of disease.

Under these circumstances it would probably have seemed best to have avoided all classifications, and to have arranged the several diseases and injuries alphabetically on the tabular forms, but for the facility of comparing the mortality tables of the present census with other valuable civil and military mortuary statistics, which could be secured only by adapting the London classification; for this classification is now in use by the registrar general of England, who employs it in his invaluable annual reports, which, being based upon the actual registration of each death at the time of its occurence, furnish by far the largest and most valuable mass of mortuary statistics in existence. It has also been adopted in the able and trustworthy annual reports of the medical department of the British army. Moreover, it agrees so nearly in its general outlines with the well-known classification of Dr. Farr, so long employed by statisticians both in England and in this country, as to render it very easy to compare statistical tables, prepared in accordance with either plan, with those prepared in accordance with the other.

If it could be shown that the classification of the English college was based essentially upon false and injurious pathological notions, which would be countenanced to some extent by its adoption, the objection would have very great weight, in spite of the very great convenience resulting from the adoption of a plan so favorable to the comparison of results obtained under so many different conditions of time and place; but, in point of fact, the new classification of the college is, to a great extent, an arbitrary one; motives of convenience rather than pathological dogmas guided its construction. It can, therefore, consistently be used for convenience sake by all, and without serious offense to the individual opinions of any.

The same advantages belonged to the classification of Dr. Farr to a greater extent than has been generally acknowledged. But such designation as *Zymotici*, *Miasmatici*, *Dietici*, *Diathetici*, prefixed to some of his classes and orders, were found to give offense in many quarters, and undoubtedly stood in the way of the general adoption of his plan. Stripped of these objectionable titles, with some consolidations and some minor changes, however, the plan of Dr. Farr has ripened into the present classification of the college.

The general considerations underlying this classification are briefly as follows:

So far as possible, diseases are grouped in accordance with the organs or set of organs deranged; that is, those diseases which are clearly connected with morbid changes of each particular part of the body, as of the liver, the intestines, the kidneys, the ovaries, the brain, &c., are grouped together, and these affections are again collected into larger groups, such as diseases of the digestive organs, of the urinary organs, of the genital organs, of the nervous system, &c. After all those diseases which can properly be referred to local lesions are grouped, a considerable number of "general diseases," that is, of affections which appear to involve a great number of diverse organs, or the "whole frame, rather than any special part of it," remain to be considered.

These general diseases are grouped by the collège in two sections, A and B. The first are chiefly acute, the second chiefly chronic disorders. In the language of the preface to the nomenclature of the college—

"Section A comprehends those disorders which appear to involve a morbid condition of the blood, and which present, for the most part, but not all of them, the following characters: They run a definite course, are attended by fever, and frequently by eruptions on the skin, are, more or less, readily communicable from person to person, and possess the singular and important property of generally protecting those who suffer them from a second attack. They are apt to occur epidemically.

"Section B comprises, for the most part, disorders which are apt to invade different parts of the same body, simultaneously or in succession. These are sometimes spoken of as constitutional diseases, and they often manifest a tendency to transmission by inheritance."*

Such are the general outlines of the plan. For its full details, reference may be made to the original publication of the college,† and to the American reprint issued by the American Medical Association.‡

After fixing upon a classification, the next step in preparing the tabular forms to be used for the Mortuary Statistics of the Ninth Census was to determine which diseases and injuries should be presented separately. The nomenclature of the college enumerates over eleven hundred different affections, and, of course, a selection of the more important became imperative. The selection was not attempted until an actual enumeration of a large portion of the census returns had been made, and lists prepared showing, for several of the principal States, the actual number of deaths from each of the diseases mentioned in the returns. It was then agreed that those affections, to which comparatively larger numbers of deaths were attributed, should be separately given in the tables. The same was done with those to which importance attached from their frequent occurrence elsewhere, as shown in other statistical tables, even though the number of deaths reported were few; and the remaining affections were embraced under the head of "Other diseases," of the group to which they belonged. Of course, disorders which did not appear on the returns as having caused any deaths, are omitted from the tabular forms, even when, as in the case of epidemic cholera, &c., they have at other times produced great mortality.

The lists selected were carefully compared with the English registration reports, and with the Mortality Tables of former censuses, in order that no diseases of importance might be omitted.

The nomenclature and classification, as adopted, will be seen in full in the summaries of Tables V and VI for the United States, in which it will be noticed that the names of the diseases embraced under each group are numbered. In the tables for each State, space has been economized by omitting the titles of those diseases from which no deaths were reported, and, as the same numbers are given to the same diseases of each group in all the tables, it is easy to see at a glance which diseases are omitted in each State table, the omission, in every case, representing the fact that no deaths from that disease have been reported for that State.

It was for a time considered whether it would not be desirable to prepare supplementary tables, showing separately the number of cases of each of the diseases embraced under the head of "other diseases," in the several groups, as has been done in the English registration reports; but, on the whole, it was thought that the facts which might thus be presented were not of sufficient importance to warrant the outlay required for their proper preparation and publication. It may be mentioned, however, that the materials for the compilation of a series of such supplementary tables have been carefully preserved, and are accessible to any investigators who may be willing to bestow the necessary labor upon their discussion.

Finally, it may be suggested to those who would have preferred a mere alphabetical list of diseases, that a brief study of the classification employed in these tables will make it easy to compare any individual disease with the same affection as presented in those tables in which diseases are arranged alphabetically.

2. As to what divisions of the country should be separately presented in the Mortality Tables.

It was earnestly urged that the plan of presenting totals for certain groups of States, as pursued in the Mortality Tables of the Eighth Census, should be abandoned. In view of the growth of the country during the last ten years, and of the prospect of further rapid development, it seemed imperatively demanded that the facts relating to the mortality of each State and Territory should be separately presented.

Further subdivisions will undoubtedly become necessary in the future. As a first step in this direction, it was recommended by Dr. Billings that the extensive State of Texas should be represented by two tables; one for so much of the State as lies east of the Colorado River, the other for the portion west of that stream.

3. With regard to the question whether the record of deaths should be presented by months or by quarters, it was considered that monthly tables were so desirable that, in any choice between the two plans, that of presenting the facts by months should have preference. It then became a question whether totals for each quarter should also be presented, and this was decided in the negative. It would have occupied much space, and entailed considerable additional cost, without answering any very useful purpose. For it must be borne in mind that the English registration tables represent ordinary chronological years, each beginning January 1 and terminating December 31. The American census returns, on the other hand, represent neither chronological years nor the congressional fiscal year, which begins annually July 1 and terminates June 30 of the year following; but, necessarily, from the terms of the law, a peculiar irregular year terminating June 1.

* The Nomenclature of Diseases, drawn up by a joint committee appointed by the Royal College of Physicians, of London, (subject to a decennial revision.) London, 1869. Preface, p. viii.

† *Loc. cit.*

‡ Philadelphia, 1869.

The schedule issued for the mortality returns of the Ninth Census called for the "name of every person who died during the year ending June 1, 1870."

Now, the English registration year is divided into four quarters, of three months each, terminating, respectively, March 31, June 30, September 30, and December 31. These divisions are purely arbitrary, and do not represent the seasons.

In the Eighth Census, besides giving monthly tables, it was endeavored to prepare quarterly totals for periods corresponding to the English. To do this it was necessary to unite the first month represented in the census, viz, June, 1859, with the last two, viz, April and May, 1860, and thus the influence of season is marked by the variations between two different years. Of course, the resulting apparent facility of comparison with the English tables is only apparent.

It was not thought best to follow this example, but it will be easy for those who desire to compare the results for any particular quarter to obtain the necessary data from the monthly tables here given.

In the monthly table (Table VI) the individual months have been arranged in the usual order, beginning with January. It must, however, be understood that, while the several months from January to May, inclusive, belong to the year 1870, the months subsequently given, from June to December, inclusive, belong to the year 1869.

I have the honor to be, very respectfully, your obedient servant,

J. J. WOODWARD,
Assistant Surgeon, United States Army.

Brigadier General J. K. BARNES,
Surgeon General, United States Army.

REMARKS UPON THE STATISTICS OF MORTALITY.

It the value of the Statistics of Mortality in a census of the United States, taken under existing laws, depended upon the return of substantially the whole body of deaths occurring during the year covered by the enumeration, the results would not be worth the space occupied by publication, much less the expense of collection and compilation. At no one of the three censuses taken under the act of May 23, 1850, has the aggregate number of deaths returned by the assistant marshals risen above two-thirds of the number of deaths probably occurring during the year of enumeration, as that number is deduced from the experience of other countries, from the experience of sections of our own country having an established system of registration, and from the ascertained law of the national increase.* With such wholesale omissions from the number of deaths, therefore, if the Statistics of Mortality depended for their value on any assumed completeness in the returns of assistant marshals, the whole would deserve a contemptuous rejection at the outset, and not an elaborate and expensive compilation and publication; but, as matter of fact, the value of the following statistics arises from the consideration that these tables distribute a body of deaths approaching half a million, among the several periods of life, between the two sexes, according to cause of death and month of death, by race, by nationality, and by occupation. Deeply as it is to be regretted that the census of the United States does not afford the material for determining exactly the death-rate of States and sections, and of deducing the effect of the various conditions of life upon the duration of life, from statistics complete and accurate in every particular, the Tables of Mortality in the census have still their value. Many and important principles may be derived with assurance from them, even in their present fragmentary condition; while it is within the power of science to reconstruct and reconstitute them into something closely approaching the facts of the case, to supply the missing parts, to restore lost links of connection, and to effect a result of substantial truth and harmony.

It is easy to explain the cause of the wholesale omissions from the return of deaths in the census, which have been referred to. To take the recent census as an example, the census law required the return of all deaths occurring in families, from the 1st of June, 1869, to the 31st of May, 1870; in all, twelve months. The enumeration in the course of which this was to be accomplished began on the 1st of June, 1870, and closed, nominally, on the 1st of October, but really about the 1st of January, 1871. Thus, the officers of the census were called upon to recover all the deaths occurring during the census year, at a distance in time ranging from one day to nineteen months from the dates at which such deaths severally occurred. The antecedent improbability of success in such an attempt would be of the strongest; while the actual experience of three censuses has shown that assistant marshals fall short of the true number of deaths by not far from 40 per cent., as a rule. In some cases assistant marshals fail to put the question; in others, heads of families, or persons answering for them, fail to recall the fact of a death occurring during the year, especially when ten or eleven months have already elapsed since the date of death, and the mind, not unnaturally, refers to the event as having taken place a year or longer before. In still another large number of cases, persons die *out of families*, which class of cases seems not to have been in contemplation of the census law, which makes the return of mortality a family return. In still other cases, deaths occur in families, but the very death itself breaks up the family and scatters the surviving members, leaving no one to report the death in the census. In still other cases, deaths occur in what are constructively families for the purposes of the census, *i. e.*, boarding-houses, hotels, &c., but the common tie of membership or association is here so casual and so slight that the chances are altogether against the circumstance being retained in memory six or eight months after.

The Superintendent is under obligations to E. B. Elliott, esq., chief clerk of the Bureau of Statistics of the Treasury Department, for the following discussion of the probable rate of mortality in the United States, as projected from the partial and fragmentary returns of mortality in the census and their reduction to the practical forms of a life-table.

* The dimensions attained by the life-insurance interest, within the past few years, make it peculiarly a matter of regret at the present time that the census should not afford the data for determining with absolute precision and certainty the death-rate of the country, whether in the aggregate or by classes of the population. This can never be done without a national scheme of registration, stringently enforced by penalties. Such a scheme, however, does not exist, and is, perhaps, in the nature of our Government, wholly impracticable. The number of States which provide for themselves a system of registering births, deaths, and marriages, will probably increase from decade to decade, while the results of registration will improve steadily with each year for which the effort is continued, affording thus fuller and better material for correcting errors and supplying deficiencies in the census statistics; but it is too much to expect, for many a decade to come, that all the States will join in efforts to secure exact information of this character.

TREASURY DEPARTMENT, *Washington, D. C., October* 15, 1872.

In compliance with your request to be furnished with a "life-table," based on that portion of the returns of the United States census, which purports to show distributed, according to age, the number of persons living on the first day of June, 1870, and the number of deaths which occurred during the twelve months which immediately preceded that date, I have prepared the following analysis and statement.

An important difficulty is encountered, at the outset of an attempt to arrive even approximately at a table which shall fairly represent the law of mortality obtaining in the general population, in the fact, manifest on intelligent inspection and confirmed by careful comparison with other and analogous and trustworthy data, that the number of deaths reported as having occurred in the period above referred to falls far short of the number which must have taken place.

In conducting the investigation proposed, this deficiency could only be supplied by resort to a somewhat arbitrary assumption, limited, however, by an investigation of the rates of mortality relative to population, which obtain in other communities, so far as accessible, and in portions of our own country.

In the construction of the following tables the deficiency in the returns of deaths was assumed to be *forty-one* per cent. of the full number of deaths which must have taken place. This assumed deficiency gives a general rate of mortality not differing greatly from that obtaining in England and Wales, and is also in substantial accord with the results of observation at different periods in the State of Massachusetts, in our own country. It is impossible to determine with precision the amount of deficiency in the return of deaths, but from the results herein computed on the assumption of a deficiency of forty-one per cent, it is easy to calculate corresponding values which shall conform to the assumption of any other supposed rate of deficiency.

The distribution of the ages of the living population, and of the deaths, as furnished by the official returns of the census, although to some extent faulty, yield ratios which, augmented as above described, have been accepted in the construction of the following tables as satisfactorily correct.

TABLE I.—*United States Census*, 1870.

Ages—years.	Population at specified ages.	Deaths at specified ages.	Rate of mortality to population on the assumption of a deficit of 41 per cent. in the return of deaths.

* The numbers in this column, from the age of 20 years to the extreme of old age, are the result of careful adjustment. The sum of the numbers between the ages of 20 and 45, of 45 and 70, and of 70 and 95, respectively, in the unadjusted series of Table I, (Column 4,) and in the adjusted series of Table II, (Column 2,) are identical; but in the adjusted series of all the numbers from the age of 20 years to the extreme limit of old age, are connected by a single exponential law of relation. The numbers above the age of 20 are left as in Table I, undisturbed.

TABLE III.—*Approximate Life-table, (continued,) constructed on the basis of the United States Census of* 1870, *showing, for different ages of life, the number of persons surviving out of* 100,000 *born alive; the number of persons living at and over those ages in a stationary population sustained by* 100,000 *annual births; and the mean future duration of life.*

Ages. / Years.	Proportion born and surviving specified ages; also, annual deaths at and over specified ages in a stationary population sustained by 100,000 annual births.	Persons living at and over specified ages in a stationary population sustained by 100,000 annual births.	Mean future duration (or "expectation") of life from specified ages.

100	57.9	103.0	1.779
105	2.9	3.6	1.260

In column (2) of Table III is shown the number surviving the different ages of life, out of 100,000 persons born alive. Thus, out of 100,000 born alive, 69,864 survive age 10; 65,083 survive age 20; 42,606 survive age 50; 9,544 survive age 80; 58 reaching the advanced age of 100 years. In column (4) of the same table is shown the mean after-life time, or mean future duration of life corresponding to the different ages specified. Thus, at birth, the mean future duration of life indicated is 39¼ years; at age 20, 38¼ years; at age 40, nearly 26½ years; at age 60, nearly 15 years; and at age 80, about 6 years.

Let $P_{x:y}$ denote the number of persons living between the ages of x and y years in a stationary population; that is, in a population uninfluenced by migration, and in which the losses by reason of advancing age and by deaths at each interval of age are exactly compensated by gains from advancing age, and from births; and let $f.\ P_{x:y}$ (that is, f times $P_{x:y}$) denote the corresponding number of persons living in a fluctuating population in which obtains the same invariable law of mortality; that is, in a population in which the numbers at the different intervals of age are increasing or decreasing; the number of persons annually passing from any age-interval not being exactly compensated for by the number of persons entering that interval.

Let $\delta_{x:y}$ denote the corresponding annual number of deaths between the ages of x and y in the stationary population; the corresponding number of deaths in the fluctuating population, considered with reference to the middle of the period in which the deaths occur, when the number of the population is large and the interval of age small, would therefore be nearly represented by $f.\ \delta_{x:y}$; and if $M_{x:y}$ be taken to denote the annual rate of mortality of persons in the fluctuating population between the specified ages, it would consequently, also, denote the rate of mortality obtaining at the same ages in the stationary population; that is, $M_{x:y} = \frac{f.\ \delta_{x:y}}{f.\ P_{x:y}} = \frac{\delta_{x:y}}{P_{x:y}}$. Such rate of mortality may, therefore, be considered as independent of the fluctuating character of the population from which it is derived.

The numbers living at different small intervals of age, and the corresponding number of annual deaths in a fluctuating population being accurately known, it is possible from these data to ascertain the proportionate numbers of the living and of deaths in the corresponding stationary population.

These deduced numbers, when tabulated, constitute forms in which a life-table, so-called, may be presented. From such life-table may easily be computed mean future duration of life at different ages; also, life annuities at different rates of interest of money, and other monetary values contingent on the duration of human life.

In passing, summarily, by a novel and compendious process, from the rates of annual mortality at different intervals of age, in a fluctuating population, to the forms of a life-table, or table of values expressing the conditions of a stationary population, advantage was taken of the important analytical principle, necessarily underlying all data of this character, that the rate of mortality within specified limits of age ($M_{x:y}$) in a stationary population, is, also, the derivative (or differential co-efficient) of the Napierian logarithm, taken negatively, of the number of persons surviving within the specified limits of age, ($-D_{\epsilon}^{\lambda} P_{x:y}$); or the differential co-efficient of the Napierian logarithm, taken negatively, of the probability that the persons living within the specified limits of age will survive a moment of time,

$$-{}_{\epsilon}^{\lambda}\left(\frac{P_{x+dx:y+dy}}{P_{x:y}}\right) \cdot \frac{1}{dx}$$

that is—

$$M_{x:y} = \frac{\delta_{x:y}}{P_{x:y}} = \frac{-D\,P_{x:y}}{P_{x:y}} = -D_{\epsilon}^{\lambda}\,P_{x:y} = -{}_{\epsilon}^{\lambda}\left(\frac{P_{x+dx:y+dy}}{P_{x:y}}\right) \cdot \frac{1}{dx}$$

d, denoting the differential of the quantity to which it is prefixed; D, denoting the derivative or differential co-efficient of such quantity; ε, (the Greek *epsilon*,) denoting the Napierian base, (to wit, 2.71828;) the symbol λ_ε denoting the Napierian logarithm of the quantity to which it is prefixed, and λ_{10} denoting its common logarithm.

It follows, convenient laws of relation being assumed to connect the several successive rates of mortality, that the inverse derivative (or the integral co-efficient) of the specified rate of mortality, ($\mathfrak{C}\, M_{x:y}$), is the Napierian logarithm, taken negatively, of the number of persons living within the specified limits of age in the stationary population; that is—

$$\mathfrak{C}\, M_{x:y} = \lambda_\varepsilon\, P_{x:y} + \text{a constant};$$

and, consequently, that the definite inverse derivative (or definite integral) of such rate of mortality, taken from one age-interval ($x : y$) to the equal age-interval next following, ($y : z$,) is equivalent to the difference between the Napierian logarithms of the number of persons living in the earlier age-interval, ($\lambda_\varepsilon\, P_{x:y}$), and of the number living in the next later equal age-interval ($\lambda_\varepsilon\, P_{y:z}$); that is—

$$\mathfrak{C}\,{}^{y:z}_{x:y}\, M_{x:y} = \lambda_\varepsilon\, P_{x:y} - \lambda_\varepsilon\, P_{y:z}$$

and is, therefore, equivalent to the Napierian logarithm, taken negatively, of the probability that the persons living in the earlier age-interval ($x : y$) will survive the later ($y : z$) of the two intervals.

That is—

$$\mathfrak{C}\,{}^{y:z}_{x:y}\, M_{x:y} = -\lambda_\varepsilon \left(\frac{P_{y:z}}{P_{x:y}}\right)$$

Successive summation of these results, from the earliest of the equal intervals of age onward toward extreme old age, will give, relatively to the value in the earliest interval, successively, the Napierian logarithms of the proportionate numbers living in the later intervals. From this series of values may be readily obtained the common logarithms of such values ($\lambda_{10}\, P_{x:y}$), and the values themselves, ($P_{x:y}$).

The proportionate number of persons living in the stationary population ($P_{x:y}$) in the successive intervals of age being thus determined, the corresponding number of deaths ($\delta_{x:y}$) may be found by multiplying such proportionate number by the corresponding rate of mortality ($M_{x:y}$), already ascertained;

thus—

$$\delta_{x:y} = M_{x:y} \times P_{x:y}$$

By successive summation of the numbers living, ($P_{x:y}$), and of the deaths ($\delta_{x:y}$) at the different consecutive intervals of age, beginning with the extreme limit of old age, may be found the proportionate numbers, at and over specified ages in the stationary population, both of the living ($P_{x:\omega}$) and of annual deaths, ($\delta_{x:\omega}$);

thus—

$$P_{x:\omega} = P_{x:y} + P_{y:z} + \quad . \quad . \quad P_{v:\omega} = Q_x$$

which equals the proportionate number of persons living at and over any specified age (x); and,

$$\delta_{x:\omega} = \delta_{x:y} + \delta_{y:z} + \qquad \delta_{v:\omega} = L_x$$

which equals the proportionate number of annual deaths at and over the specified age (x) in the stationary population, and is equivalent, also, as may be shown, to the proportionate number of persons surviving the specified age out of the annual number of births (L_0) by which the stationary population is sustained.

In the foregoing formulas and tables. ω (the Greek *omega*) is employed to denote the extreme limit of old age, and the symbol $\mathfrak{C}$ to denote the inverse derivative (or integral co-efficient) of the quantity to which it is prefixed.

The quotient of the proportionate number of persons in the stationary population at and over a specified age, as Q_x, divided by the number surviving the specified age (L_x) out of the annual number of births by which the stationary population is sustained, gives, in years, the mean future duration of life, (commonly called "expectation" of life,) (E_x).

The great deficiency manifest in the returns of deaths, a deficiency inherent in any system which seeks to secure complete returns of these events for an entire year by simply conducting an inquiry at its close, will, for the future, it is earnestly hoped, be remedied by legislation, establishing a national system for the registry of deaths and of births as they occur.

By no simpler or less radical process is it possible for the statistics of the movement of population of the United States to be placed on a par, as to efficiency and completeness, with that of England, France, Belgium, Prussia, Sweden, Norway, and certain other of the progressive states of Europe. Legislation by the several States of the Union is necessarily inadequate to the accomplishment of this object.

Mr. A. W. Paine and Mr. D. C. Marshall, acting under special detail from the Census Office, deserve special mention for the care and accuracy with which they have performed the numerical computations.

E. B. ELLIOTT.

NOTE.—*Anomalous entries.* A few entries in Table V of the present volume may appear strange and questionable, if not wholly impossible and absurd. These are the cases of death, under the age of 3 years, and even of 1 year, from gout, from calculus, from diabetes, from cancer of the uterus, and from disorders of the intellect; and of death at 10, 15, and even 25 years of age, from cholera infantum and from teething. It might also seem to one not familiar with Mortuary Statistics that cancer of the breast should not be assigned as the cause of death in males. The doubtful cases of these classes number in all about 160.

Some of these entries are undoubtedly due to clerical errors on the part of assistant marshals in transcribing their schedules, or to ignorance on the part of families making return of deceased members. Some of the most unmistakable might, perhaps, with advantage have been corrected by the Superintendent; but it has been thought best to exercise great caution in departing from the strict letter of the return, even for the sake of avoiding criticism.

Cholera infantum may be a proper description of the cause of death up to 10 or even 12 years of age, especially where the subject is exceptionally immature and feeble. The 7 cases, above the age of 15, reported from this cause, are probably the result of errors of transcription or otherwise, and should be assigned to some other head in the same general class.

Teething, again, may be a proper description of the cause of death up to the age when the last teeth are finally cut, although the 12 deaths reported from this cause, above the age of 5 years, were more probably due to necrosis of the jaw, connected with teething, and, therefore, in the apprehension of the family, confounded with it.

Cancer of the uterus, under 1 year of age, is possible, but exceedingly improbable, and the single death from this cause, reported within this period of life, is undoubtedly an error.

Calculus and diabetes are established causes of death in children of the earliest age, and the reasonableness of the entries in Table V is sufficiently proved by reference to European statistics.

Gout, although congenital, can hardly be accepted as a cause of death under the age of 1 year, and the single entry to that effect in Table V is probably an error.

Disorders of the intellect may and do cause death in infants of a very early age, and the 4 cases reported under 1 year, although questionable, cannot be pronounced clearly wrong.*

Cancer of the breast is a perfectly proper specification as a cause of death in males, although the number of such cases reported (47) would, perhaps, justify a doubt with regard to some of them.

---

* "Disorders of the intellect," in the nomenclature adopted, includes idiocy.

THE PROPORTION OF DEATHS IN THE UNITED STATES, FROM EACH CAUSE AND CLASS OF CAUSES TO DEATHS FROM ALL CAUSES, AND TO POPULATION—1870, 1860, 1850.

DEATHS FROM CERTAIN PRINCIPAL DISEASES SEVERALLY AND IN GROUPS, WITH THE PROPORTION TO DEATHS FROM ALL CAUSES, AND TO POPULATION—BY STATES AND TERRITORIES—1870.

CANCER OF THE BREAST, OF THE UTERUS, AND OTHER CANCERS.								CEREBRO-SPINAL, ENTERIC, AND TYPHUS FEVERS.								DIARRHŒA, DYSENTERY, AND ENTERITIS.								
Deaths from cancer of the breast.	Deaths from cancer of the uterus.	Deaths from other cancers.	Deaths from cancer of the breast, of the uterus, and other cancers.	Deaths from cancer of the breast, the uterus, and other cancers in 100,000 deaths from all causes.	Deaths from all causes to one death from cancer of the breast, of the uterus, and other cancers.	Deaths from cancer of the breast, the uterus, and other cancers, in 100,000 living persons.	Living persons to one death from cancer of the breast, of the uterus, and other cancers.	Deaths from cerebro-spinal fever.	Deaths from enteric fever.	Deaths from typhus fever.	Deaths from cerebro-spinal, enteric, and typhus fevers.	Deaths from cerebro-spinal, enteric, and typhus fevers in 100,000 deaths from all causes.	Deaths from all causes to one death from cerebro-spinal, enteric, and typhus fevers.	Deaths from cerebro-spinal, enteric, and typhus fevers in 100,000 living persons.	Living persons to one death from cerebro-spinal, enteric, and typhus fevers.	Deaths from diarrhœa.	Deaths from dysentery.	Deaths from enteritis.	Deaths from diarrhœa, dysentery, and enteritis.	Deaths from diarrhœa, dysentery, and enteritis in 100,000 deaths from all causes.	Deaths from all causes to one death from diarrhœa, dysentery, and enteritis.	Deaths from diarrhœa, dysentery, and enteritis in 100,000 living persons.	Living persons to one death from diarrhœa, dysentery, and enteritis.

(*a*) In Tables I, II, III, IV, and V, of the Mortality Statistics of the Seventh Census, Ex. Doc. 98, 23d Cong., 2d Sess., the aggregate number of deaths is given as 323,023. On page 44 of the same volume, the number is given as 323,272. On page xli. of the quarto volume of the Seventh Census, the aggregate number of deaths is given as 324,394. The number here given (323,098) is taken from Table VI, page 29, of the Mortality Statistics, and has been found to agree with the aggregates as given in the detailed statements by States and districts in that volume, on pages 49 to 301 inclusive.

(*b*) No deaths reported.

(*c*) Including 130 whites, whose sex was not reported.

(*d*) Including 48 whites, whose sex was not reported.

TABLE II.

MORTALITY OF THE UNITED STATES,

(BY STATES AND TERRITORIES,)

WITH

DISTINCTION OF SEX AND AGE,

DURING

THE CENSUS YEAR ENDED JUNE 1, 1870.

STATISTICS

OF

BLIND, DEAF AND DUMB, INSANE, AND IDIOTIC.

NOTE.—In Tables X, XII, XIV, XVI, and XVIII the several classes of unfortunates appear in the numbers in which they are found by the assistant marshals in each State and Territory at the date of enumeration. Tables XI, XIII, XV, and XVII exhibit the numbers of each class born in each State and Territory wherever residing at the date of enumeration.

REMARKS

UPON THE

STATISTICS OF THE BLIND, DEAF AND DUMB, INSANE, AND IDIOTIC.

TABLES X TO XIX.

It is held by many persons conversant with the special subject, that the returns of the census in respect to the blind and the deaf and dumb, and also, in a higher degree, to the insane and the idiotic, are always, and necessarily, considerably below the fact. F. B. Sanborn, Esq., of Massachusetts, late secretary of the board of charities for that commonwealth, has advanced the opinion that the numbers reported in the census, be it State or National, rarely embrace more than sixty or seventy per cent. of their respective classes.

The Superintendent certainly can claim not to be bigoted in his defense of the accuracy of the census as taken under existing laws, nor does he desire to exhibit a disposition to close, were it in his power, the discussion of this question by a dogmatic denial of the charge of large omissions in the returns of the Afflicted Classes of our population at the census.

It is fair to say, however, that the opinion referred to would appear to have been formed, in advance of anything like a general and systematic investigation, from *impressions* derived from casual observation or partial inquiry, and therefore to have hardly authority enough to withstand positive official statements.

Up to the time the following tables were sent to press, the sole attempt, known to the Superintendent, which had been made to supply absolute data by which to test the results of the census in this particular, was in Massachusetts, where a list, bearing a somewhat indefinite date, but formed between the State census of 1865 and the Federal census of 1870, had been prepared, of the deaf and dumb of the commonwealth.

This list contains an aggregate of 821 names. Examination, however, shows that while, for two or three years, names were added, from time to time, to complete it, only 18 names were, during that time, stricken from the roll, as lost by death or by removal from the State. Of course, among so large a number as 821, the casualties for such a period could not but have been far more numerous. It would certainly be fair to assume a rate of mortality among the Afflicted Classes not below that of the community generally, after excluding infants of an age too early to allow such infirmities as are being considered to become developed and recognized.

Still further scrutiny of the list shows that the actual statement of the individual case in no small proportion of instances fails to bear out the title of the list itself. Thus, of the total of 821 persons, only 692 are distinctly and in terms put down as "deaf and dumb," while 41 appear as "dumb," 14 as "mute," 73 as "deaf," and 1 simply as "idiotic."

The Superintendent does not take the responsibility of saying that none of the persons reported as "mute" or as "dumb," or even of the larger number reported under the more questionable title of "deaf," were not deaf-mutes or deaf and dumb; but it is certainly fair to demand, in a list prepared solely with a view to this single consideration, something like accuracy of definition; and if accuracy of definition cannot be attained in so simple a matter, what reason to expect accuracy of description?

But the reductions above indicated are not the only ones to which this list must be subjected before it can fairly be put in comparison with the census returns of Massachusetts for 1860 and 1870. From entries in red ink, it appears that 117 names were added to the list, on account of the deaf and dumb of Massachusetts, found in 1867 among the inmates of the asylum for the deaf and dumb at Hartford, Connecticut. But by the census law the pupils of the Hartford asylum are required to be returned on the schedules for Connecticut, as having their "usual place of

abode" therein; and, as a matter of fact, 118 persons, deaf and dumb, born in Massachusetts, were returned by the proper assistant marshal of Hartford, on the 1st of June, 1870, and will be found in the following tables. If, therefore, the 117, added as above to the Massachusetts list, be subtracted from the total number who were distinctly and in terms reported to the State board of charities as "deaf and dumb," we shall have but 575 who were, at any date that may be taken as the date of the list, whether 1866, 1867, or 1868, fairly subject to enumeration within the State of Massachusetts, according to the conditions of the census law. The number returned by the assistant marshals to the Census Office, on the 1st of June, 1870, was 538. The difference would be easily accounted for by the failure, already indicated, to follow up on the State list the changes from death or removal; and were this cause not sufficient, it would neither be an unfair nor a violent assumption that a list thus prepared by piecemeal, and exhibiting so much looseness both of definition and construction, might contain other important errors which would need to be corrected before the positive count of the census could be discredited through its instrumentality.

Since the following tables were sent to press, this office has received, by favor of the secretary of the Illinois State board of charities, the lists, prepared for or by that board, of the insane and the idiotic of that State. The list of idiotic has not been examined for the purposes of these remarks; but the list of insane has been subjected to a careful comparison with the returns of the census, name by name. This comparison exhibits such an utter want of correspondence, at nearly every point, as not only renders criticism impossible, but is, in itself, wholly inexplicable. The list of the board of charities contains 2,376 names. Eighty-eight might be deducted on various accounts: duplication, 41, death, 14, recovery of reason, 31, and removal from the State, 2. In addition to the above, 6 are characterized as "idiotic," 32 are indicated by remarks as "probably recovered," "friends feel hopeful," &c., and 24 are marked "declined," which word is supposed to refer to the action of those in charge of asylums and to justify a doubt as to the fact of insanity. But after all reasonable allowance on these accounts, there would probably remain something like 2,250 insane persons in Illinois, by the count of the State board of charities. Only 1,621 insane persons were returned by the assistant marshals in the census, leaving the difference unaccounted for. Upon the mere statement of such a difference, it might reasonably be assumed that the assistant marshals of Illinois had failed to properly characterize, as insane, persons otherwise reported upon their schedules. But a critical examination of the two lists and a comparison of names dispose of this assumption and leave the difference wholly inexplicable, except upon the ground of radical and total vice in one or the other of the two lists being compared. Out of the total number of 2,376 names on the State list and 1,621 names on the census list, only 721 are found to be common to the two lists. Thus the State list contains 1,655 names which are not on the census, while the census contains 900 names which are not upon the State list. In the view of such monstrous discrepancies, it would be reasonable to assume that, inasmuch as the returns of the census are made by sworn officials visiting each house and family by turn, while the list of the State board of charities would appear to have been made up by no class of officials, and even by no distinct class of persons, the board must have been imposed upon, either through negligence or design on the part of its correspondents. This, which would appear to be the natural presumption upon the first statement of such discrepancies, is confirmed and rendered almost certain by the results of a careful search which has been instituted with a view to ascertaining whether the names of persons appearing on the State list as "insane" but not returned as such by assistant marshals, are to be found at all, in any connection, upon the schedules of the census, which, it should be stated, purport to present the name and personal description of every man, woman, and child in the community. Three hundred and ninety-nine names thus borne upon the State list as "insane," belonging to one hundred and twenty-three towns and cities, were sought for throughout the entire body of the returns of their respective towns, covering a population of about half a million. Of this number only forty-five were found reported, as of any condition, on the schedules; and, in a considerable proportion of cases, no family of the same surname was found within the town to which the State list assigned the person for whose name search was made.

When, in contrast to facts like the above, it is stated that the census as an agency, whether State or National, is always steadily consistent with itself in respect to the numbers of the Afflicted Classes, never departing far from the ratios exhibited in the following tables, it must, the Superintendent thinks, be admitted that the figures of the census are entitled to full credence, until impeached by evidence more carefully and systematically gathered than any yet presented.

NOTE.—In the above are included 493 persons having a double or treble affliction or infirmity. The details of such double or treble afflictions are given in Table XIX. When these separations shall have been made, the result will be as follows:

	Cases.	Persons.
(1) Number who are simply blind	20,026	20,026
(2) Number who are blind and also deaf and dumb	96	96
(3) Number who are blind and also insane	75	75
(4) Number who are blind and also idiotic	105	105
(5) Number who are blind, deaf and dumb, and also insane	7	7
(6) Number who are blind, deaf and dumb, and also idiotic	11	11
Making the total under the head of "blind"	20,320	20,320

	Cases.	Persons.
Number who are simply deaf and dumb	15,892	15,892
(7) Number who are deaf and dumb, and also insane	59	59
(8) Number who are deaf and dumb, and also idiotic	140	140
Number who are deaf and dumb, and included in (2,) (5,) and (6)	114	.....
Making the total under the head of "deaf and dumb"	16,205	16,091

	Cases.	Persons.
Number who are simply insane	37,291	37,291
Number who are insane and also included in (3,) (5,) and (7)	141	
Making the total under the head of "insane"	37,432	37,291

	Cases.	Persons.
Number who are simply idiotic	24,271	24,271
Number who are idiotic, and also included in (4,) (6,) and (8)	256	
Making the total under the head of "idiotic"	24,527	24,271
Total of all classes	98,484	97,973

The difference of 511 is therefore accounted for as follows:

	Persons.	Repetitions.
Number twice included	475	475
Number three times included	18	36
Total	493	511

TABLE XX.

BIRTHS

OF

PERSONS BORN IN EACH CENSUS YEAR

AND SURVIVING AT

THE CLOSE OF EACH CENSUS YEAR,

BY

MONTHS AND QUARTER-YEARS AT THE CENSUS OF 1870;
FOR THE ENTIRE YEAR AT THE CENSUSES OF 1860 AND 1850;

WITH

THE PROPORTION OF SUCH PERSONS TO POPULATION,

(BY STATES AND TERRITORIES)

REMARKS ON THE TABLE OF BIRTHS.

The table following, of the months of birth of the persons under 1 year of age, surviving on the 1st of June, 1870, has value only as a somewhat fragmentary part of the data requisite for the construction of a true table of births.

It will be noticed in the first place that, of those born during the twelve months ending June 1, this table only embraces such as survive at the close of that period. The aggregate number included in the table is, therefore, less than the total number born during the year, by the number of those who, having been born during the year, have also died during the year. The experience of European countries has shown that, in order to a survivorship of 100, there should have been from 109 to 113 born. The neglect of this distinction has led some very pretentious writers on population into gross errors in dealing with the results of former censuses of the United States, for the purpose of deducing therefrom the law of our national growth. The disparaging conclusions thus derived as to the vigor of our pure American stock, in contrast with that of the several foreign elements of our population, have been widely trumpeted, and have come to be accepted in many quarters as authentic, while, in fact, wholly without value or significance.

Moreover, it has been evident to careful observers that, even after allowance for those dying within the year, something more is still needed to be done to the statistics of "persons under 1 year," at the censuses of 1850 and 1860, before they can be taken as even approximately correct for the purposes of determining the birth-rate of the country. Thus, the number reported in 1850 as under 1 year was only 629,446, out of a total population of 23,191,876, or 1 in 36.8, while the number reported at 1860 was only 934,582, out of a total population of 31,443,321, or 1 in 33.6.

Now, it is clear at a glance that such a birth-rate as is here indicated will not support a population in a condition of such rapid advance as characterizes the progress of population in the United States.

But while it has been clear that the numbers of this class, returned in 1860 and in 1850, were below the fact, it did not appear, nor could it be deduced, from the results furnished by the compiled ages at either census, what caused the deficiency; what was its degree, or where, specifically, it resided. The total number under 1 was not divided into the several months of the year, so that it might be seen whether the omissions took place with approximate uniformity among the months, while the total number from 1 to 5, was not distributed into yearly periods, so that it might be determined whether the loss of the "under 1 year" period was compensated by the gain in the period from 1 to 2. The assumption most favored by statistical writers of repute was, that the deficiency of the period under 1 year was a dead loss; that is, that the children of that age were actually omitted from enumerations and not carried forward into the next period of life.

The Superintendent has been disposed to take a somewhat different view of the cause of the deficiency in the period under 1 year, and to believe that the result of dividing the year into its constituent months would be to show such a falling off in the last two or three months, going backward from the date of enumeration, as to amount to a demonstration that the deficiency noted was due to the tendency, if not of mothers, at least on the part of fathers, nurses, servants, and unsympathetic fellow-boarders, to speak of infants of ten and eleven months old as a year old; that the defect complained of, therefore, did not result from the omission of names from the schedules, but from an erroneous classification; and that all which was lost from the "under 1 year" period would be found in the period next succeeding. With a view to reducing this matter, so far as possible, to certainty, assistant marshals were instructed, in preparation for the Ninth Census, to record the month of birth for the living inhabitants under 1 year; and the blank schedules issued for the enumeration were adapted to this end. Moreover, when the compilation of results was commenced, it was determined for this reason, as well as for other and larger reasons, to separate the period 1 to 5 into yearly terms. These two measures, it was clear, would put it in the power of the Census Office to deal with all the questions arising out of this feature of the census at a decided advantage as contrasted with the opportunities for such computations afforded by preceding censuses.

When the report of the Superintendent was rendered, in December, 1871, the statistics of the month of birth,

as gathered in the census, had been tabulated for five or six States, and the results seemed completely to confirm the hypothesis just alluded to, viz, that the entire loss of the period under 1 year would be compensated out of the next year period. Of every State for which the figures were at that time available, it held true that the number of births returned for each of eight, nine, or ten consecutive months, (going backward from the date of enumeration,) was reasonably full, the aggregate for these fractions of a year being amply sufficient to account for the increase of population observed between 1860 and 1870, and the variations from month to month, within such fractional periods, being such only as in the nature of things would probably occur. After these fractional periods, however, the numbers returned for the remaining months of the year were so grossly or grotesquely inadequate as to establish a moral certainty that the inadequacy was due in the main, if not wholly, to the tendency to speak in round numbers, from which it would result that parents, nurses, and house-servants would, in a very large proportion of cases, characterize children approaching 1 year as a year old.

Generally, it may be said of the States whose statistics of the month of birth were available for the purposes of that report, that the falling off in the tenth month, (going backward still from the date of enumeration,) though decided, was of a degree which, in a single case, might have been accepted as possible and reasonable under the influence of exceptional causes, but which, occurring through the whole list, showed the existence of a serious disturbing cause affecting the completeness of the returns of the census in this particular; that the falling off in the eleventh month was such as in no single case could, for a moment, be explained on any other ground than that of a general omission or an erroneous classification of the persons properly appearing in this class; while, for the twelfth month, the numbers returned became ridiculously small, the class in some States almost disappearing.

Now, upon such a showing, and without any other data than that obtained from this subdivision of the "under 1 year" period into its constituent months, for the first time at the Ninth Census, by which to explain the startling deficiency in the return of births for the months approaching the complete year, the Superintendent, even in the light of the results developed by further investigation not then possible, apprehends that but one assumption was justifiable, namely, that the persons who should have been reported in the census as ten or eleven months old, had been reported as a year old, and had consequently gone into the next class in the tabulation of ages. Upon this assumption, then, the Superintendent acted in the premises, and, in the report of December 20, 1871, (made a part of the Population Volume of the present series,) indicated this as the true explanation of the heretofore unexplained deficiency in the number of persons reported at the census (whether for 1850, 1860, or 1870) as under one year of age.

Since that report, however, not only have the statistics of the month of birth for the other States of the Union become available for the purposes of comparison, but the complete tabulation of the ages of the living population has been effected. As previously remarked, the period 1 to 5, which, in the publications of the Seventh and Eighth Censuses, was given entire, has, in compilation of the Ninth Census, been resolved into its constituents, thereby enabling us, for the purposes of such discussions as the present, to deal separately with the number of the living inhabitants severally from 1 to 2, from 2 to 3, from 3 to 4, and from 4 to 5. Here, then, was afforded the opportunity for testing the soundness of the hypothesis that the error noted was due, not to omissions of persons from the census, but to the erroneous classification of persons actually returned. If the elements of the problem were as simple as had been assumed, the number in the period 1 to 2 would be found in excess, and, to a degree, reasonably corresponding to the deficiency in the last three months of the period under 1. Candor compels the Superintendent to confess that the problem is more complex than appeared at the date of the report of December, 1871, and that the results of subdividing the period 1 to 5 show a vice of classification extending much further than from the last quarter of the first year to the end of the second. The second year itself was found to be deficient, and it was discovered that any plan for compensating the loss of the "under 1 year" period must involve the re-grading of pretty much the whole period under 5.

The Superintendent, finding the elements of the case so much more complicated than he had supposed, and deeming it desirable that an attempt should be made to construct a true table of the month of birth, and to re-distribute the entire period under 5 among its constituent years, if the material at command would allow this being done, and believing that if this were to be done at all it should be by some scholar not only habituated to the use of the highest functions of mathematics, but having a name for the character of his work in fields of investigation where the Superintendent himself treads very gingerly, and rarely ventures at all, placed all the available data relevant to the subject in the hands of a gentleman having wide reputation and high authority in such studies, with the request that he would favor the Census Office and the country by treating them according to the methods by which he had dealt with the vital statistics of Massachusetts, England, France, Belgium, and Prussia, in the construction of life-tables which have become standard both in this country and in Europe. Mr. Elliott has kindly consented, notwithstanding the pressure of other public duties, and the Superintendent has great

pleasure in introducing his discussion of the subject as a valuable contribution to the Vital Statistics of the United States.

The following communication has been received from Mr. Elliott in connection with this subject:

TREASURY DEPARTMENT, *Washington, D. C., October* 1, 1872.

I have carefully examined the data which you have placed in my hands.

The irregularity in the numbers of population returned during the first two years of life, especially during the latter half of the first year, is very marked.

You desire the data to be so adjusted as to present approximately a correct exhibit of the distribution of the population of the United States during the first few years of life, more especially during the first five years. This task I have undertaken, with the following general results:

In a community comprising a large population, the number of persons existing within successive equal intervals of age should, as a rule, gradually diminish with advancing age. Under a strictly accurate census, involving large numbers, this rule will, in general, be found to hold, not merely with respect to a *stationary* population—that is, with respect to a population in which the *loss* at each interval of age caused by advancing age, by death, and by emigration, is exactly compensated by the gain arising from births, from advancing age, and from immigration, but also with respect to a population *fluctuating* by reason of excess or deficiency in the number of births, as compared with the number of deaths, and by any ordinary excess or deficiency in the number of immigrants as compared with the number of emigrants.

Inspection of the tabulated returns of the United States census of 1870 shows that the numbers purporting to represent the population at the earlier years of life, especially under the age of five years, do not conform to this standard, and the deviations are so marked and extreme as to impress the conviction that they are, to a notable extent, erroneous, and to demand inquiry as to the probable amount and distribution of the error.

According to the returns, the number under 1 year of age (that is, for the first year of life) is smaller than the number from 1 to 2, (that is, for the second year of life,) and the number returned for the second year of life is, in turn, smaller than that for the third year. From this age onward, however, the general progress does not conflict with the test above assigned, the number diminishing by somewhat regular gradations with advancing age.

The following table shows, according to the United States census of 1870, the numbers for each of the first five years of life, and the annual mean of the first two years, compared with that of the three years next following:

Age in years.	Number of persons living for each annual interval of age.	Yearly mean.
0 to 1	1,100,475	1,089,639
1 to 2	1,078,803	
2 to 3	1,143,139	1,111,812
3 to 4	1,113,782	
4 to 5	1,078,514	

From this table it will be seen that the mean of the number of the first two years of life, (to wit, 1,089,639,) is *less* by *two* per cent. than the mean of the numbers of the three years next following, (to wit, 1,111,812.)

In England, according to the census of 1861, the mean of the earlier two years (to wit, 568,380) is in *excess* of the mean of the three years next following (to wit, 521,340) by *nine* per cent.

In France, Italy, and Norway the corresponding rates of excess, according to the censuses of 1861 and 1865, respectively, are *ten*, *seventeen*, and *fourteen* per cent.

In the calculated series of numbers for the United States, hereinafter given, the corresponding rate of excess is nearly *twelve* (11.7) per cent., manifestly a more probable rate than that furnished directly by the census.

Interval of age.	England and Wales, 1861.		France, 1861.		Italy, 1861.		Norway, 1865.	
Years.	Number of persons living within each interval of age.	Yearly mean.	Number of persons living within each interval of age.	Yearly mean.	Number of persons living within each interval of age.	Yearly mean.	Number of persons living within each interval of age.	Yearly mean.
0-2, (2 years)	1,136,761	568,380	1,530,728	765,364	1,294,556	647,278	99,728	49,864
2-5, (3 years)	1,564,021	521,340	2,081,433	693,811	1,665,135	555,045	130,733	43,578

NOTE.—While the numbers in the several groups of ages for France and Italy, in the above table, are harmonious, reference to the table in the Appendix, (page 531,) where the figures are given by single years, will show, in respect to those countries, that irregularities exist of the same kind as those existing in the United States, which form the subject of this discussion, though at different points and far less marked in degree. The censuses of Great Britain and Norway, for these years, are free from defects of this character.

The irregularity noticeable in the first year, and the apparent defect in the returns of the United States census for the last half of the first year of life, are very marked. During the first six months, the tabulated number returned is 701,272, being a monthly mean of 116,879, numbers not varying greatly from, but probably in excess of, the actual numbers within that half-year interval of age. During the last six months of the year the number returned is 399,203, showing a monthly mean of only 66,534, a falling off of 43 per cent., which is incredible, from the number returned for the first six months.

The number returned during the second year of life is 1,078,803, a monthly mean of 89,900; this mean being 35 per cent. in excess of the mean of the preceding six months, but two per cent. less than the mean of the preceding twelve months, and 23 per cent. less than the mean of the first six months of life.

The following table exhibits by quarters and half-years the number and the monthly mean of persons returned, under the United States census of 1870, as surviving during the first year of life, commencing with the month of May, 1870, (the month immediately preceding the date of the census,) and reckoning backward; and also the number and monthly mean for the entire second year of life.

Ages by months.	Months.	Number of persons surviving.	Monthly mean.
0 to 3	May, 1870 April, 1870 March, 1870	355,130	118,377
3 to 6	February, 1870 January, 1870 December, 1869	346,142	115,381
6 to 9	November, 1869 October, 1869 September, 1869	273,272	91,091
9 to 12	August, 1869 July, 1869 June, 1869	125,931	41,977
0 to 6	May back to December, inclusive.	701,272	116,879
6 to 12	December back to June, inclusive.	399,203	66,534
0 to 12	Entire year	1,100,475	91,706
12 to 24	Second year	1,078,803	89,901

The following table shows, according to the United States census of 1870, the number of persons returned as surviving for each month of the first twelve months of life; also, the number living during each quarter-year; also, the number living during each year of the first five years of life; also, the number living under twenty-five years of age during each five-year period. The table also shows the proportion surviving at each of these periods, out of 100,000 persons, at all ages specified in the returns; also, the number of children surviving at each of the intervals specified under one year of age.

Age.	United States census of 1870.			
	Months of birth.	Number of persons surviving at different intervals of age.	Proportion to 100,000 persons of all specified ages.	Proportion to 100,000 children under one year of age.

The question may quite naturally arise whether any such disparity as is shown by the preceding table obtains with respect to the number of the immediate survivors of those born alive at different seasons of the year.

Trustworthy returns of such survivors in England and Wales, a country the vital conditions of which most nearly approach our own, do not show any such actual disparity, nor do the returns of births and of deaths in early life from other countries, from a number of which the requisite data are in possession, afford margin which would allow of so great an inequality.

The following table, prepared by Dr. Farr, the eminent statistician, for the English Life-Table No. 3, shows the number surviving each month of life under 1 year of age, distinguishing sex, calculated from the population under 1 year of age, according to the censuses of 1841 and 1851, and from the corrected births; and from the deaths registered in the 17 years, (1838–1854,) under 3 months, at 3 and under 6 months, and at 6 months and under 1 year.

Age.	Proportion living at birth, and at the end of each month of age.		
Months.	Both sexes.	Boys.	Girls.
0	1, 000, 000	511, 745	488, 255
1	953, 497	484, 958	468, 539

11	857, 025	431, 450	425, 575
12	850, 507	428, 026	422, 481

In the following table is shown the number of births, by quarter-years, for the year 1869; also, the annual mean by quarter-years for the five years, 1865–1869, in Massachusetts, according to the State official returns, a law having been in force for many years in that State for the compulsory registration of births and other data illustrat-

ing the movement of population. This table also shows the mean annual number of births in England and Wales by quarter-years, according to official returns for the thirty-three years, 1838–1870.

Period.	Number of births occurring in each quarter-year.			Proportion in each quarter-year to 100,000 born during a year.		
	Massachusetts.		England and Wales.	Massachusetts.		England and Wales.
	1869.	1865–'69. 5 yr's average.	1838–'70. 33 y'rs average.	1869.	1865–'69. 5 y'rs average.	1838–'70. 33 y'rs average.
January, February, March — First quarter	7, 955	7, 711	163, 572	22, 010	22, 451	26, 159
April, May, June — Second quarter	8, 284	7, 948	163, 712	22, 921	23, 141	25, 894
July, August, September — Third quarter	9, 963	9, 261	153, 781	27, 568	26, 964	24, 058
October, November, December — Fourth quarter	9, 939	9, 426	152, 667	27, 501	27, 444	23, 889
Entire year	36, 141	34, 346	633, 732	100, 000	100, 000	100, 000

From this table it will be seen that the disparity between the numbers born at the different seasons of the year is not sufficient to account for the extraordinary contrasts which are shown in the actual returns of the census, between the survivors of those born at different periods of the year immediately preceding the date (June 1, 1870) to which the enumeration of the population is by law referred.

It may be interesting here to note the fact that, while in England the number of births during the first half of the calendar year is somewhat in excess of the mean for the year, in Massachusetts the reverse is the case, the greater proportion of births occuring in the latter half of the year.

The following table shows the number of births, by months, registered in Massachusetts during the year 1869; also the proportion in each month on the basis of 100,000 born alive during the year, in comparison with like data in Norway for the average of the three years, 1867, 1868, 1869, and in Sweden for the average of the two years, 1869, 1870:

Period.	Massachusetts.		Norway.		Sweden.	
	No. of births, 1869.	Proportion in 100,000 per annum.	No. of births, average 1867–'68–'69.	Proportion in 100,000 per annum.	No. of births, average 1869–'70.	Proportion in 100,000 per annum.

Entire year	36, 141	100, 000	52, 828	100, 000	122, 579	100, 000

An important influencing cause of the irregularities is believed to be found in the fact that, although the enumeration was made with reference to the population as it existed on the 1st day of June, 1870, yet the actual

collection of the facts by the marshals was extended over a period of several months subsequent to that date, some of the enumerations having been made as late as nine months after the date designated by law. Inquiries, therefore, relative to the month of birth of children under the age of twelve months, living on the first day of June, 1870, required not unfrequently that investigation be made relative to the month of birth of children who were, at the date of actual enumeration, from 16 to 20 months of age. With respect to these more distant months of birth, it is believed that there was less effort in general by the enumerator to secure the requisite information, and greater difficulty encountered in successfully conducting the inquiries.

It is earnestly hoped that, in future censuses of the population, the system will be followed which has proved so successful in England and certain other countries of Europe, to wit, that of taking the census in one day, or as nearly so as is possible, through the instrumentality of a prior distribution of schedules, to be filled up with reference to a single night; such schedules to be collected by the enumerators on the following day, or as soon thereafter as practicable.

We may adjust the irregularities in the data under consideration by one of two methods—the one based on the assumption that there is no actual deficiency in the number of persons enumerated, but that the irregularities observed are due exclusively to an erroneous distribution of the numbers as regards age; that there may be, for some cause, or combination of causes, a general tendency on the part of the enumerators to record the ages of those under two years, and especially those of the second half of the first year of life as either less advanced or more advanced than accords with fact. The other method is based on the assumption that the irregularities in question are not to be wholly accounted for by imperfect distribution as respects age; but that, in addition to a faulty distribution, there were, with regard to the younger ages, actual deficiencies in the returns, and that some considerable portion of those who were under the age of two years escaped enumeration.

The latter assumption is deemed the more probable.

An adjustment of the data under the age of five years has, however, been prepared in accordance with each of these two assumptions, and is herewith presented: the one, on the assumption that the irregularities in question are due entirely to faults in distribution; the other, that they are due in part to defective distribution of the numbers returned, and, in part, to actual omissions. (See also Tabular groups A and B in Appendix.)

In the foregoing table the third column exhibits the reported number of the population in 1870, according to the officially published abstract. The fourth and fifth columns give adjusted values, the adjustment being made in conformity with the rule that the numbers of the population, in equal intervals of age, diminish gradually with advancing years. In the preparation of the former of these two columns, there has been no addition from without to supply supposed omissions; but the average number under the age of 5 years, and also from ages 5 to 25 in this adjusted column, are retained the same as furnished by the returns. In the second of the adjusted columns, however, the number expressing the aggregate of the adjusted values, under the age of five years, has been augmented by an addition of 100,000 to supply supposed omissions.

It will be seen, on comparing the observed series of values (column 3) with the first of the adjusted series of values, (column 4,) that 171,250 of the number of persons reported as surviving in the last three years of the first five-year group are transferred to the first two years of that group, making the entire number under two years of age, in the adjusted series, 2,350,528 instead of 2,179,278, as in the observed or unadjusted series.

On comparing the values in the observed series (column 3) of that table with those in the second series of adjusted values, (column 5,) it will be seen that the number in the first two years of life has been augmented by 216,939, 100,000 of which were added from without for supposed omissions, and the remaining 116,939 transferred from the group of three years of age next following, the number of persons in the adjusted series, under the age of two years, thereby becoming 2,396,217, instead of the observed number, 2,179,278.

Each of these adjusted series conforms, as already stated, to the test of progressive and gradual diminution with advancing years.

The annual number of births furnished by each of these formulas is somewhat in excess of the annual average number of survivors returned for the first six months of life.

Population of the United States at all ages—1870.—Proportion at different intervals of age of 100,000.

Age.	Month of birth.	Observed.		Adjusted without additions for assumed omissions.		Adjusted with 100,000 added under the age of five years for assumed omissions in returns.

0 to 2		5,653	2,826	6,097	3,048	6,199	3,100
2 to 5		8,651	2,884	8,207	2,736	8,326	2,775
0 to 5		14,304	2,861	14,304	2,861	14,525	2,905
All other specified ages		85,696		85,696		85,475	
All specified ages		100,000		100,000		100,000	

In the foregoing table is shown, with reference to the series of observed values and of adjusted values, the proportion living at each monthly and annual interval of age, under the age of five years, out of 100,000 at all ages specified in the returns; also, the average annual number indicated for each age-interval by such proportionate numbers. For example, the proportionate number living between the ages of six and twelve months, according to the returns, (columns 3 and 4,) was, for every 100,000 of population of specified ages, 1,035, corresponding to an annual rate of 2,071. According to the first of the adjusted series, (columns 5 and 6,) that in which no allowance is made for supposed omissions, the proportionate numbers between the ages of six and twelve months, out of 100,000 population of specified ages, would be 1,534, corresponding to an annual rate of 3,068.

In the second of the adjusted series, that in which allowance is made for 100,000 supposed omissions, (columns 7 and 8,) the proportion in this age-interval of six months would be 1,561, corresponding to an annual rate of 3,123.

The aggregate number of persons stated as of "unknown age," in the published abstract of the census returns, is 5,161; or about one and one-third ($1\frac{1}{3}$) in every ten thousand persons of specified ages.

In the foregoing tables no attempt has been made to distribute the numbers of the "unknown ages" among those of the specified ages.

The addition, however, to each of the numbers representing the several specified ages of life, of one and one-third in every ten thousand at such ages, both in the "observed" and in each of the "adjusted" series, will readily give a proportionate distribution of the numbers returned as of "unknown age."

For the correctness of the numerical computations for the accompanying tables, credit is in large measure due to Mr. A. W. Paine, of the Census Bureau, who has been detailed by you for the purpose of aiding in their construction.

E. B. ELLIOTT.

APPENDIX.

PROCESS OF CONSTRUCTION OF THE ADJUSTED SERIES.

The process adopted for the adjustment of the irregularities of the observed values is as follows:

Let $P_{0:x}$ denote the number of persons living *at and under* the age of x years; then, obviously, will $\frac{1}{x} P_{0:x}$ denote the *annual mean* of such number.

For $\frac{1}{x} P_{0:x}$ put X, and let the formula—

$$(1) \qquad X = A - (A - B)\left(\frac{x-a}{b-a}\right)^q$$

express the law of relation which connects the values of X (or $\frac{1}{x} P_{0:x}$) for different ages of life. A, it is manifest, will be that value of X which corresponds to age a, (that is, A will equal $\frac{1}{a} P_{0:a}$) and B will denote that value of X which corresponds to the age b, (that is, B will equal $\frac{1}{b} P_{0:b}$). In like manner C may be so taken as to denote that value of X (or $\frac{1}{x} P_{0:x}$) which shall correspond to the age of c years, (that is, C may be made equivalent to $\frac{1}{c} P_{0:c}$); and from formula (1) may be derived the following expression:

$$(2) \qquad A = \frac{\left(\frac{c-a}{b-a}\right)^q B - C}{\left(\frac{c-a}{b-a}\right)^q - 1}$$

The number of persons returned by the enumerators of the United States census as living *at and under* the age of five years ($P_{0:5}$) was 5,514,713, the annual mean $\left(\frac{1}{5} P_{0:5}\right)$ being consequently 1,102,942.6; and the number returned as *at and under* the age of *twenty-five* years ($P_{0:25}$) was 22,904,502, the annual mean $\left(\frac{1}{25} P_{0:25}\right)$ consequently being 916,180.08.

In the computation of the *first* series of adjusted values, those of Group A, based on the assumption that the irregularities observable are wholly due to faulty distribution, and not at all to actual omission, (see Tables following,) B was taken to denote $\frac{1}{5} P_{0:5}$ or $\frac{5,514,713}{5}$ equal to 1,102,942.6, the annual mean of the number of persons returned as living at and under the age of five years; and C as denoting $\frac{1}{25} P_{0:25}$ or $\frac{22,904,502}{25}$ equal to 916,180.08, the annual mean of the number of persons returned as living at and under the age of twenty-five years; while A was taken to denote $\frac{1}{0} P_{0:0}$ the corresponding annual number of births. To q was given the value $\frac{3}{10}$ from which it follows by substitution in Formula (2) that the value of A (the number of persons born alive) was 1,403,852.5, a number slightly in excess of 1,402,544, the annual mean of number of persons returned as living under the age of six months.

$$\text{Thus, } A = \frac{\left(\frac{25-0}{5-0}\right)^{\frac{3}{10}} 1,102,942.6 - 916,180.08}{\left(\frac{25-0}{5-0}\right)^{\frac{3}{10}} - 1} = 1,403,852.5$$

By the substitution of these data in formula (1,) given above, were computed the several values given in Group A, Table I, column 3. From these values were obtained, by multiplying each by the corresponding age (x,) the series of values in Group A, Table II, column 3. The successive differences of the numbers constituting this series gave the series of values in Group A, Table III, column 3.

In the computation of the *second* series of adjusted values, those of Group B, based on the assumption that the irregularities observed in the unadjusted values are due in part to faulty distribution, and in part to actual omission in the enumeration at the younger years of life, 100,000 was added to the number returned under the age of five years, making $P_{0:5}$ for that period 5,614,713 persons, the annual mean of such adjusted number $\left(\frac{1}{5} P_{0:5}\right)$ becoming 1,122,942.6. B was taken equal to the annual mean so adjusted, and C as equal to the annual mean of the number under the age of 25 years, $\frac{23,004,502}{25}$, or 920,180.08.

To q was given the value $\frac{1}{3}$, the corresponding value of A, (the annual number of births, $\frac{1}{0} P_{0:0}$) consequently being 1,408,533, a number somewhat in excess of the mean annual number of survivors indicated by the returns of the first six months of life.

By the substitution of these values for the constants, A, B, and q in the general formula (1,) above given, the series of numbers in Group B, Table I, column 3, were computed. From the adjusted values in Table I, the adjusted values in Tables II and III are readily derived.

GROUP A.

TABLE I.

Table showing the *average annual number* of persons *at and under different specified ages* $\left(\frac{1}{x} P_{0:x}\right)$ within the first twenty-five years of life, according to the "observed" or unadjusted returns of the United States census of 1870, and also as "adjusted," together with the difference between the observed and adjusted.

In the formation of the adjusted series of this table *no addition* has been made for assumed omissions.

Table showing the *number* of persons *in each specified age-interval* ($P_{x:y}$) within the first twenty-five years of life, according to the "observed" or unadjusted returns of the United States census of 1870; and also as "adjusted," together with the differences between the observed and adjusted.

In the formation of the adjusted series of this table, 100,000 has been *added*, under the age of five years, for assumed omissions.

x to y Years.	$P_{x:y}$		Difference.
	Observed.	Adjusted.	
1.	2.	3.	4.
0 to 1-12	117, 081	111, 298^{7}	− 5, 782^{3}

NOTE.—The following table exhibits the processes by which the adjusted results in the tables of Groups A and B, severally, are reached. The figures given for illustration are those pertaining to the tables of Group B. (See Group B, Table I, column 3, ages 0, 5, and 25, respectively.) The symbol λ is here employed to denote that the common logarithm of the quantity to which it is prefixed is to be taken.

$$A = 1{,}408{,}533^{4}.$$
$$B = 1{,}122{,}942^{6}.$$
$$C = 920{,}180^{08}.$$

$$\lambda\left(\frac{A-B}{\sqrt[3]{5}}\right) = 5.2227542$$

x	λx	$\lambda(\sqrt[3]{x})$	$\lambda\left(\frac{A-B}{\sqrt[3]{5}}\sqrt[3]{x}\right)$	$\frac{A-B}{\sqrt[3]{5}}\sqrt[3]{x}$	$A-\frac{A-B}{\sqrt[3]{5}}\sqrt[3]{x}$

(a) Assuming that the slaves at 1850 were all native.
(b) At the census of 1850 the blacks and mulattoes were not distinguished by sex or nativity.

THE TABLES OF AGES.

REMARKS ON THE TABLES OF AGES.

It has been thought desirable to reproduce here, in explanation of the following tables, the remarks upon the compilation of ages at the Ninth Census which were contained in the report of the Superintendent, November 26, 1871. Two or three slight verbal changes have been required to adapt the remarks to their present place.

In the compilations of the present census, it has been invariably held to be a desirable thing to retain the forms and molds of preceding census publications, in order to make comparison practicable. The only cases where departure from this rule has been allowed in any particular are those in which the specifications or classifications of previous publications have been thought to be essentially vicious, and therefore more to be honored in the breach than in the observance. Where inadequacy merely has been complained of, the effort has been made to introduce new divisions or new groupings, while retaining the old so far as to allow comparison to be made with former results.

The classification of the Ages of living inhabitants adopted in the compilations of 1860, was as follows: Under 1; 1 to 5; 5 to 10; 10 to 15; 15 to 20; 20 to 30; 30 to 40; 40 to 50; 50 to 60; 60 to 70; 70 to 80; 80 to 90; 90 to 100; each year above 100 being specified. The most evident criticisms upon this classification are as follows: The period 1 to 5 is too long, both from the great number to be reported in that class, and from the fact that the conditions of life change to an important degree with each year under 5. A minuter subdivision ought to be made. Especially is this true with a view to computing, for any scientific purpose, the number of survivors from this class at any time during the interval between two censuses. Secondly, decennial periods are too extensive to allow of anything like nicety of calculation. Quinquennial periods have been adopted for the compilations of the present census. Thirdly, it may seem very strange, when it is considered that one of the principal objects of the census, from the earliest times, in all countries, has been to ascertain the military strength of the people, that the period at which the military age begins has never thus far been obtained in the United States. It is difficult to conceive of any species of information which can, from a practical point of view, have precedence in a census over the determination of the number of males between 18 and 45. Fourthly, compilations of preceding censuses have totally disregarded another fact of the highest value, namely, the number of males in the country above the age of 21 years. If any information in regard to the number of persons, according to age, might be supposed to be of interest to the political philosopher, it is the number of persons of voting age. Fifthly, there is quite as much reason for obtaining the number of persons who are above 80 *by single years*, as for obtaining the number above 100 by single years. It cannot be questioned that the additional information would be of great use, not merely in calculations purely scientific, but in computing the expectation of life with reference to life annuities and life insurance.

In fact, this whole matter of decennial periods for the tabulation of ages exhibits a singular disregard of the proper objects of statistical inquiry under a government like ours. The decimal system may be a very good one to introduce into coinage and to govern weights and measures, but it means nothing when applied to the important events of human life. Twenty years means nothing more than any other period; but eighteen years, the age at which a man enters the militia of his country; twenty-one years, the age at which a man becomes a voter in every State of the Union; these periods do mean something, and hold important relations to political science.

At the same time, while introducing new specifications of age into the compilation of the present census, for the reasons presented above, care has been taken to keep up the comparative character of the Ninth Census. In accordance with this principle, the age of twenty years has been introduced into the tables, not because it is of any importance in itself more than any other single year, but in order to enable comparison to be made between this class at the present and at preceding censuses.

In view of the consideration presented above, the following classification of ages has been adopted in the compilations of the present census: Under 1; 1; 2; 3; 4; 5 to 10; 10 to 15; 15 to 18; 18 to 20; 21; 21 to 25; 25 to 30; 30 to 35; 35 to 40; 40 to 45; 45 to 50; 50 to 55; 55 to 60; 60 to 65; 65 to 70; 70 to 75; 75 to 80; 80; 81; 82; 83; and upward, by single years.

Another most important distinction which has been introduced into the tabulation of results is the distinction between native and foreign-born in the Tables of Age and Sex. This distinction has involved no inconsiderable addition to the work of preparing these tables, but it is exceedingly desirable. From the table of the native population by age and sex we are able to see how the various conditions of life in the United States affect the duration of life to those who are born here and grow up through their childhood under the influence of our soil and climate. From the table of the foreign-born population we see how those who have derived their original constitution from foreign stock, and have grown up, generally to manhood, under other influences, are affected by coming under the influence of American climate and American habits of life. By merging these two classes, as has heretofore been done, we obtain neither. The foreign-born population is lost in the greater numbers of the native, while at the same time it is sufficiently numerous seriously to affect the proportions of the latter, and, perhaps, in certain classes, entirely to reverse results.

TABLE XXII.

AGES,

WITH SEX FOR EACH PERIOD OF LIFE,

OF

THE POPULATION OF THE UNITED STATES,

IN THE AGGREGATE, WITH NATIVITY AND RACE,

AT THE CENSUS OF 1870,

AND IN THE AGGREGATE, WITH RACE,

AT THE CENSUSES OF 1860 AND 1850.

TABLE XXII.—THE UNITED STATES—1870.

TEMPERATURE CHART OF THE UNITED STATES.

Showing the Distribution by Isothermal lines of the

Mean Temperature for the Year

Constructed under the direction of Prof. Joseph Henry *Secretary Smithsonian Institution.*

by Charles A. Schott, Asst. U.S. Coast Survey

in October 1872.

Shore line from the Coast Survey, mountains from Government Surveys

TABLE XXIV.

AGES

WITH SEX AT EACH PERIOD OF LIFE,

OF

THE NATIVE POPULATION OF THE UNITED STATES,

AT THE CENSUS OF 1870,

(BY STATES AND TERRITORIES.)
